4. PRE-TEST PROCESSES

4.1. Verification of specimen

Efectis Era Avrasya A.S. verified the used materials and parts against the supplied data and drawings during installation of the test specimen and not involved in the selection of test specimen.

The test specimen was assembled by the sponsor (NEVPANEL YAPI MADEN ÜRETİM İTH. İHR. SAN. VE TİC. LTD. ŞTİ.)

4.2. Conditioning

The construction was stored in the laboratory of Efectis Era Avrasya A.S. under the following conditions:

- Ambient temperature: $15,75 \pm 1,25$ °C.
- Relative humidity: 58 ± 4 %.

5. TEST PROCESS

5.1. Method

The fire test was conducted according to the standard EN 1364-1:2015.

The heating of the furnace followed the standard fire curve, as specified in the standard EN 1363-1:2012.

The target overpressure in the furnace was 0 Pa at 500 mm above floor level and 19 Pa at the top of the test specimen.

5.2. Measurements

Following test data were measured during the test:

- Ambient temperatures inside the furnace with six plate thermocouples (Furnace TC1 to TC6); evenly distributed over the directly heated surface (see figure A1).
- The pressure in the furnace, measured at a height of 2,9 meter above the furnace floor level (see figure A3).
- Ambient temperature in the laboratory (see figure A4)
- The surface temperatures on the unexposed side of the test specimen (TC 3 up to TC16, see figure B2 and B3).
- Deflection measurements of the test specimen (see figure B4 and Table B1).
- There was no need to use roving thermocouple.
- The positions of the thermocouple and displacement measurements are given in figure B1.

7. TEST RESULTS

7.1 Results

The results are given in Table 2 and appendixes B and C.

During the heating the temperature in the laboratory complied with the standard EN 1363-1:2012.

7.2 Uncertainty of measurements

Due to the nature of fire resistance testing, in which several non-linear effects are present in both the test configuration and the test specimen, which influence each other, it is at this moment not yet possible to give a stated degree of uncertainty of measurement

8. SUMMARY

The most important results of the examination are given in table 2.

Table 2: Summary of test results of the test specimen

Integrity, (E)	
- Cotton pad	no failure,
- Gap gauges Ø 6 mm	no failure (not applied)
Ø 25 mm	no failure (not applied)
- Flames longer than 10 sec.	not observed.
Insulation; [I]	
- average temperature	no failure
- maximum temperature	86 th minute by TC 14.

The heating was terminated at 121st minute after consulted with the customer.

9. FIELD OF DIRECT APPLICATION OF TEST RESULTS

9.1 General

This report details the method of construction, the test conditions and the results obtained when the specific elements of construction described herein was tested following the procedure outlined in EN 1363-1:2012, and when appropriate EN 1363-2:1999. Any significant deviation with respect to size, constructional details, load stresses, edge or end conditions other than those allowed under the field of direct application in the relevant test method is not covered by this report

9.2 Specific conditions for dimensions and fixing

- decrease in height
- increase in the thickness of the wall
- increase in the thickness of component materials
- decrease in linear dimensions of boards or panels, but not thickness
- decrease in stud spacing
- decrease in distance of fixing centres
- increase in the number of horizontal joints
- increase in the number of horizontal joints
- horizontal and vertical joints, of the type tested.

9.3 Extension of height

The height of the construction may be increased to 4 meters for a fire resistance of **45 minutes** for the criteria integrity and thermal insulation and **120 minutes** for integrity only because the lateral deflection of the construction is less than 100 mm. See Table B1 – Appendix B.

9.4 Extension of width

The width of an identical construction may be increased, because the construction is tested with a width of 3 meters with one vertical free edge.
